## Exercise – Logical Operators
```

For each of the logical expressions below, print out what you think the resulting value will be (`true` or `false`). Then print out the actual expression to see if you were right. An example has been provided below.

```
43 == 53
print(false)
print(43 == 53)
```

```
1. `9 == 9`
*/
```

```
print(true)
print(9==9)
```

```
//: 2. `9 != 9`
print(false)
print(9 != 9)
```

```
//: 3. `47 > 90`
print(false)
print(47>90)
```

```
//: 4. `47 < 90`
print(true)
print(47<90)
```

```
//: 5. `4 <= 4`
print(true)
print(4 <= 4)
```

```
//: 6. `4 >= 5`
print(false)
print(4 >= 5)
```

```
//: 7. `(47 > 90) && (47 < 90)`
print(false)
print((47>90) && (47 < 90))
```

```
//: 8. `(47 > 90) || (47 < 90)`
print(true)
print((47>90) || (47 < 90))
```

```
//: 9. `!true`
print(false)
print(!true)
```

```
/*:
```
